

## **IN THE CLAIMS**

Please enter the below claim amendments to Claims 1, 14, and 23.

1. (currently amended) An apparatus, comprising:
  - a first matching section, connected to an input signal, and having a first output and a second output, **the first matching section providing signals at the first output and the second output having substantially equal phase and magnitude;**
  - a termination section connected to the first output; and
  - a pie-shaped impedance matching section connected to the second output and having a plurality of pie-shaped impedance matching section outputs, said pie-shaped impedance matching section outputs having substantially equal phase when connected to a predetermined load impedance.
2. (previously presented) The apparatus of claim 1, wherein said pie-shaped impedance matching section outputs have substantially equal magnitude.
3. (previously presented) The apparatus of claim 1, wherein the pie-shaped impedance matching section has a body section having a wedge-shaped geometry.
4. (previously presented) The apparatus of claim 1, wherein at least one of said plurality of pie-shaped impedance matching section outputs of the pie-shaped impedance matching section has a substantially rectangular geometry.
5. (original) The apparatus of claim 1, wherein the termination section comprises:
  - a resistor; and a capacitor connected to the resistor.
6. (original) The apparatus of claim 1, wherein the termination section comprises the series combination of a resistor and a capacitor, wherein one terminal of the series combination is connected to circuit ground.
7. (previously presented) The apparatus of claim 1, further comprising:
  - a plurality of load elements, wherein each load element is connected to one of said plurality of pie-shaped impedance matching section outputs.
8. (previously presented) The apparatus of claim 1, further comprising:
  - a plurality of op-amps, wherein each op-amp is connected to one of said plurality of pie-shaped impedance matching section outputs.
9. (previously presented) The apparatus of claim 1, further comprising:
  - a plurality of load elements; and

a plurality of transmission lines, wherein each of said transmission lines connect a corresponding one of said load elements to a corresponding one of said pie-shaped impedance matching section outputs of said pie-shaped impedance matching section.

10. (previously presented) The apparatus of claim 1, further comprising:

a plurality of load elements; and

a plurality of transmission lines, wherein each of said transmission lines connect a corresponding one of said load elements to a corresponding one of said pie-shaped impedance matching section outputs of said pie-shaped impedance matching section;

wherein each of said plurality of transmission lines is impedance matched to its corresponding load element.

11. (original) The apparatus of claim 1, further comprising a signal generating device in communication with the first matching section.

12. (previously presented) The apparatus of claim 1, wherein the pie-shaped impedance matching section comprises a conductive material.

13. (original) The apparatus of claim 1, wherein the conductive material is copper.

14. (currently amended) A system, comprising:

a first matching section connected to an input signal having a first output and a second output, **the first matching section providing signals at the first output and the second output having substantially equal phase and magnitude;**

a termination section connected to the first output;

a pie-shaped impedance matching section connected to the second output and having a plurality of outputs, said outputs of said pie-shaped impedance matching section having substantially equal phase when connected to a predetermined load impedance; and

a signal generating device in communication with the first matching section.

15. (previously presented) The system of claim 14, wherein the pie-shaped impedance matching section has a body section having a wedge-shaped geometry.

16. (previously presented) The system of claim 14, wherein at least one of said outputs of the pie-shaped impedance matching section has a substantially rectangular geometry.

17. (original) The system of claim 14, wherein the termination section comprises:

a resistor; and a capacitor connected to the resistor.

18. (original) The system of claim 17, wherein the termination section comprises the series

combination of a resistor and a capacitor, wherein one terminal of the series combination is connected to circuit ground.

19. (previously presented) The system of claim 14, further comprising:

a plurality of load elements, wherein each load element is connected to one of said plurality of outputs of said pie-shaped impedance matching section.

20. (previously presented) The system of claim 14, further comprising:

a plurality of load elements, wherein each load element is connected to one of said plurality of outputs of said pie-shaped impedance matching section; and

wherein one or more of said load elements is an op-amp.

21. (previously presented) The system of claim 14, further comprising:

a plurality of load elements; and

a plurality of transmission lines, wherein each of said transmission lines connect a corresponding one of said load elements to a corresponding one of said outputs of said pie-shaped impedance matching section.

22. (previously presented) The system of claim 21, further comprising:

a plurality of load elements; and

a plurality of transmission lines, wherein each of said transmission lines connect a corresponding one of said load elements to a corresponding one of said outputs of said pie-shaped impedance matching section;

wherein each of said plurality of transmission lines is impedance matched to its corresponding load element.

23. (currently amended) A method, comprising:

providing a plurality of pie-shaped impedance matching section outputs using a pie-shaped impedance matching section, said outputs having substantially equal phase and magnitude when connected to a predetermined load impedance;

impedance matching an input signal having a first output and a second output to the pie-shaped impedance section **such that the first output and the second output have substantially the same phase and magnitude**; and

providing a termination section connected to the first output.

24. (previously presented) The method of claim 23, wherein the step of outputting a plurality of outputs using a pie-shaped impedance matching section utilizes a pie-shaped impedance

matching section having a wedge-shaped geometry.

25. (original) The method of claim 23, further comprising loading each of said plurality of outputs with a load element.

26. (previously presented) The method of claim 25, further comprising:

impedance matching a plurality of transmission lines connecting each of said load elements to each of said pie-shaped impedance matching section outputs.

27. (previously presented) The method of claim 23, further comprising loading each of said plurality of pie-shaped impedance matching section outputs with an op-amp.

28. (currently amended) The method of claim 23, further comprising:

generating an input signal and providing the generated input signal to the pie-shaped impedance section.
